

NAG Fortran Library Routine Document

F06QVF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of ***bold italicised*** terms and other implementation-dependent details.

1 Purpose

F06QVF transforms an n by n real upper triangular matrix U to an upper Hessenberg matrix H , by applying a given sequence of plane rotations from either the left or the right, in planes k_1 to k_2 ; H has non-zero sub-diagonal elements $h_{k+1,k}$ for $k = k_1, k_1 + 1, \dots, k_2 - 1$ only.

If SIDE = 'L', the rotations are applied from the left:

$$H = PU, \quad \text{where} \quad P = P_{k_1}P_{k_1+1}\cdots P_{k_2-1}.$$

If SIDE = 'R', the rotations are applied from the right:

$$H = UP^T, \quad \text{where} \quad P = P_{k_2-1}\cdots P_{k_1+1}P_{k_1}.$$

In either case, P_k is a rotation in the $(k, k + 1)$ plane.

The 2 by 2 plane rotation part of P_k has the form

$$\begin{pmatrix} c_k & s_k \\ -s_k & c_k \end{pmatrix}.$$

2 Specification

```
SUBROUTINE F06QVF (SIDE, N, K1, K2, C, S, A, LDA)
INTEGER           N, K1, K2, LDA
double precision C(*), S(*), A(LDA,*)
CHARACTER*1       SIDE
```

3 Description

None.

4 References

None.

5 Parameters

1: SIDE – CHARACTER*1 *Input*

On entry: specifies whether U is operated on from the left or the right, as follows:

- if SIDE = 'L', U is pre-multiplied from the left;
- if SIDE = 'R', U is post-multiplied from the right.

Constraint: SIDE = 'L' or 'R'.

2: N – INTEGER *Input*

On entry: n , the order of the matrices U and H .

Constraint: $N \geq 0$.

3:	K1 – INTEGER	<i>Input</i>
4:	K2 – INTEGER	<i>Input</i>
<i>On entry:</i> the values k_1 and k_2 .		
5:	C(*) – double precision array	<i>Input</i>
<i>On entry:</i> $C(k)$ must hold c_k , the cosine of the rotation P_k , for $k = k_1, \dots, k_2 - 1$.		
6:	S(*) – double precision array	<i>Input/Output</i>
<i>On entry:</i> $S(k)$ must hold s_k , the sine of the rotation P_k , for $k = k_1, \dots, k_2 - 1$.		
<i>On exit:</i> $S(k)$ holds $h_{k+1,k}$, the sub-diagonal element of H , for $k = k_1, \dots, k_2 - 1$.		
7:	A(LDA,*) – double precision array	<i>Input/Output</i>
Note: the second dimension of the array A must be at least $\max(1, N)$.		
<i>On entry:</i> the n by n upper triangular matrix U .		
<i>On exit:</i> the upper triangular part of the upper Hessenberg matrix H .		
8:	LDA – INTEGER	<i>Input</i>
<i>On entry:</i> the first dimension of the array A as declared in the (sub)program from which F06QVF is called.		
<i>Constraint:</i> $LDA \geq \max(1, N)$.		

6 Error Indicators and Warnings

None.
