# NAG Fortran Library Routine Document

# F06SCF (ZHEMV)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

### 1 Purpose

F06SCF (ZHEMV) performs the matrix-vector operation

 $y \gets \alpha A x + \beta y$ 

where A is an n by n complex Hermitian matrix, x and y are n element complex vectors, and  $\alpha$  and  $\beta$  are complex scalars.

#### 2 Specification

SUBROUTINE F06SCF (UPLO, N, ALPHA, A, LDA, X, INCX, BETA, Y, INCY)INTEGERN, LDA, INCX, INCYcomplex\*16ALPHA, A(LDA,\*), X(\*), BETA, Y(\*)CHARACTER\*1UPLO

The routine may be called by its BLAS name *zhemv*.

#### 3 Description

None.

#### 4 References

None.

#### 5 Parameters

1: UPLO – CHARACTER\*1

On entry: specifies whether the upper or lower triangular part of A is stored as follows:

if UPLO = 'U', the upper triangular part of A is stored; if UPLO = 'L', the lower triangular part of A is stored.

Constraint: UPLO = 'U' or 'L'.

2: N – INTEGER

On entry: n, the order of the matrix A.

*Constraint*:  $N \ge 0$ .

3: ALPHA – *complex\*16* 

On entry: the scalar  $\alpha$ .

#### 4: A(LDA,\*) - complex\*16 array

Note: the second dimension of the array A must be at least max(1, N).

On entry: the n by n Hermitian matrix A. If UPLO = 'U', the upper triangle of A must be stored and the elements of the array below the diagonal are not referenced; if UPLO = 'L', the lower triangle of A must be stored and the elements of the array above the diagonal are not referenced.
