## F06TWF

**Note:** before using this routine, please read the Users' Note for your implementation to check the interpretation of ***bold italicised*** terms and other implementation-dependent details.

### 1 Purpose

F06TWF transforms an  $n$  by  $n$  complex upper triangular matrix  $U$  with real diagonal elements, to an upper spiked matrix  $H$ , by applying a given sequence of plane rotations from either the left or the right, in planes  $k_1$  to  $k_2$ .  $H$  has real diagonal elements except where the spike joins the diagonal.

If SIDE = 'L',  $H$  has a row spike, with non-zero elements  $h_{k_2,k}$  for  $k = k_1, k_1 + 1, \dots, k_2 - 1$ . The rotations are applied from the left:

$$H = PU, \quad \text{where} \quad P = P_{k_1}P_{k_1+1}\cdots P_{k_2-1},$$

and  $P_k$  is a rotation in the  $(k, k_2)$  plane.

If SIDE = 'R',  $H$  has a column spike, with non-zero elements  $h_{k+1,k_1}$  for  $k = k_1, k_1 + 1, \dots, k_2 - 1$ . The rotations are applied from the right:

$$HP^H = R, \quad \text{where} \quad P = P_{k_2-1}\cdots P_{k_1+1}P_{k_1},$$

and  $P_k$  is a rotation in the  $(k_1, k + 1)$  plane.

The 2 by 2 plane rotation part of  $P_k$  has the form

$$\begin{pmatrix} c_k & \bar{s}_k \\ -s_k & c_k \end{pmatrix}$$

with  $c_k$  real.

### 2 Specification

```
SUBROUTINE F06TWF (SIDE, N, K1, K2, C, S, A, LDA)
INTEGER N, K1, K2, LDA
double precision C(*)
complex*16 S(*), A(LDA,*)
CHARACTER*1 SIDE
```

### 3 Description

None.

### 4 References

None.

### 5 Parameters

1: SIDE – CHARACTER\*1 *Input*

*On entry:* specifies whether  $U$  is operated on from the left or the right, as follows:

- if SIDE = 'L',  $U$  is pre-multiplied from the left;
- if SIDE = 'R',  $U$  is post-multiplied from the right.

*Constraint:* SIDE = 'L' or 'R'.

2:	N – INTEGER	<i>Input</i>
<i>On entry:</i> n, the order of the matrices U and H.		
<i>Constraint:</i> N $\geq 0$ .		
3:	K1 – INTEGER	<i>Input</i>
4:	K2 – INTEGER	<i>Input</i>
<i>On entry:</i> the values k <sub>1</sub> and k <sub>2</sub> .		
5:	C(*) – <b>double precision</b> array	<i>Input</i>
<i>On entry:</i> C(k) must hold c <sub>k</sub> , the cosine of the rotation P <sub>k</sub> , for k = k <sub>1</sub> , ..., k <sub>2</sub> – 1.		
6:	S(*) – <b>complex*16</b> array	<i>Input/Output</i>
<i>On entry:</i> S(k) must hold s <sub>k</sub> , the sine of the rotation P <sub>k</sub> , for k = k <sub>1</sub> , ..., k <sub>2</sub> – 1.		
<i>On exit:</i> S(k) holds a non-zero element of the spike of H: h <sub>k<sub>2</sub>,k</sub> if SIDE = 'L', or h <sub>k<sub>1</sub>+1,k<sub>1</sub></sub> if SIDE = 'R', for k = k <sub>1</sub> , k <sub>1</sub> + 1, ..., k <sub>2</sub> – 1.		
7:	A(LDA,*) – <b>complex*16</b> array	<i>Input/Output</i>
<b>Note:</b> the second dimension of the array A must be at least max(1, N).		
<i>On entry:</i> the n by n upper triangular matrix U. The imaginary parts of the diagonal elements must be zero.		
<i>On exit:</i> the upper triangular part of the upper spiked matrix H. The imaginary parts of the diagonal elements are set to zero, except for the (k <sub>2</sub> , k <sub>2</sub> ) element if SIDE = 'L', or the (k <sub>1</sub> , k <sub>1</sub> ) element if SIDE = 'R'.		
8:	LDA – INTEGER	<i>Input</i>
<i>On entry:</i> the first dimension of the array A as declared in the (sub)program from which F06TWF is called.		
<i>Constraint:</i> LDA $\geq \max(1, N)$ .		

## 6 Error Indicators and Warnings

None.
