

NAG Fortran Library Routine Document

F07HVF (CPBRFS/ZPBRFS)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

F07HVF (CPBRFS/ZPBRFS) returns error bounds for the solution of a complex Hermitian positive-definite band system of linear equations with multiple right-hand sides, $AX = B$. It improves the solution by iterative refinement, in order to reduce the backward error as much as possible.

2 Specification

```

SUBROUTINE F07HVF(UPLO, N, KD, NRHS, AB, LDAB, AFB, LDAFB, B, LDB, X,
1              LDX, FERR, BERR, WORK, RWORK, INFO)
ENTRY          cpbrfs (UPLO, N, KD, NRHS, AB, LDAB, AFB, LDAFB, B, LDB, X,
1              LDX, FERR, BERR, WORK, RWORK, INFO)
INTEGER        N, KD, NRHS, LDAB, LDAFB, LDB, LDX, INFO
real          FERR(*), BERR(*), RWORK(*)
complex       AB(LDAB,*), AFB(LDAFB,*), B(LDB,*), X(LDX,*), WORK(*)
CHARACTER*1    UPLO

```

The ENTRY statement enables the routine to be called by its LAPACK name.

3 Description

This routine returns the backward errors and estimated bounds on the forward errors for the solution of a complex Hermitian positive-definite band system of linear equations with multiple right-hand sides $AX = B$. The routine handles each right-hand side vector (stored as a column of the matrix B) independently, so we describe the function of the routine in terms of a single right-hand side b and solution x .

Given a computed solution x , the routine computes the *component-wise backward error* β . This is the size of the smallest relative perturbation in each element of A and b such that x is the exact solution of a perturbed system

$$(A + \delta A)x = b + \delta b$$

$$|\delta a_{ij}| \leq \beta |a_{ij}| \quad \text{and} \quad |\delta b_i| \leq \beta |b_i|.$$

Then the routine estimates a bound for the *component-wise forward error* in the computed solution, defined by:

$$\max_i |x_i - \hat{x}_i| / \max_i |x_i|$$

where $\hat{x}$ is the true solution.

For details of the method, see the F07 Chapter Introduction.

5 Parameters

- 1: UPLO – CHARACTER*1 *Input*
On entry: indicates whether the upper or lower triangular part of A is stored and how A has been factorized, as follows:
 if UPLO = 'U', the upper triangular part of A is stored and A is factorized as $U^H U$, where U is upper triangular;
 if UPLO = 'L', the lower triangular part of A is stored and A is factorized as LL^H , where L is lower triangular.
Constraint: UPLO = 'U' or 'L'.
- 2: N – INTEGER *Input*
On entry: n , the order of the matrix A .
Constraint: $N \geq 0$.
- 3: KD – INTEGER *Input*
On entry: k , the number of super-diagonals or sub-diagonals of the matrix A .
Constraint: $KD \geq 0$.
- 4: NRHS – INTEGER *Input*
On entry: r , the number of right-hand sides.
Constraint: $NRHS \geq 0$.
- 5: AB(LDAB,*) – **complex** array *Input*
Note: the second dimension of the array AB must be at least $\max(1, N)$.
On entry: the n by n original Hermitian positive-definite band matrix A as supplied to F07HRF (CPBTRF/ZPBTRF).
- 6: LDAB – INTEGER *Input*
On entry: the first dimension of the array AB as declared in the (sub)program from which F07HVF (CPBRFS/ZPBRFS) is called.
Constraint: $LDAB \geq KD + 1$.
- 7: AFB(LDAFB,*) – **complex** array *Input*
Note: the second dimension of the array AFB must be at least $\max(1, N)$.
On entry: the Cholesky factor of A , as returned by F07HRF (CPBTRF/ZPBTRF).
- 8: LDAFB – INTEGER *Input*
On entry: the first dimension of the array AFB as declared in the (sub)program from which F07HVF (CPBRFS/ZPBRFS) is called.
Constraint: $LDAFB \geq KD + 1$.
- 9: B(LDB,*) – **complex** array *Input*
Note: the second dimension of the array B must be at least $\max(1, NRHS)$.
On entry: the n by r right-hand side matrix B .

- 10: LDB – INTEGER *Input*
On entry: the first dimension of the array B as declared in the (sub)program from which F07HVF (CPBRFS/ZPBRFS) is called.
Constraint: $LDB \geq \max(1, N)$.
- 11: X(LDX,*) – **complex** array *Input/Output*
Note: the second dimension of the array X must be at least $\max(1, NRHS)$.
On entry: the n by r solution matrix X , as returned by F07HSF (CPBTRS/ZPBTRS).
On exit: the improved solution matrix X .
- 12: LDX – INTEGER *Input*
On entry: the first dimension of the array X as declared in the (sub)program from which F07HVF (CPBRFS/ZPBRFS) is called.
Constraint: $LDX \geq \max(1, N)$.
- 13: FERR(*) – **real** array *Output*
Note: the dimension of the array FERR must be at least $\max(1, NRHS)$.
On exit: $FERR(j)$ contains an estimated error bound for the j th solution vector, that is, the j th column of X , for $j = 1, 2, \dots, r$.
- 14: BERR(*) – **real** array *Output*
Note: the dimension of the array BERR must be at least $\max(1, NRHS)$.
On exit: $BERR(j)$ contains the component-wise backward error bound β for the j th solution vector, that is, the j th column of X , for $j = 1, 2, \dots, r$.
- 15: WORK(*) – **complex** array *Workspace*
Note: the dimension of the array WORK must be at least $\max(1, 2 * N)$.
- 16: RWORK(*) – **real** array *Workspace*
Note: the dimension of the array RWORK must be at least $\max(1, N)$.
- 17: INFO – INTEGER *Output*
On exit: $INFO = 0$ unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

Errors or warnings detected by the routine:

$INFO < 0$

If $INFO = -i$, the i th parameter had an illegal value. An explanatory message is output, and execution of the program is terminated.

7 Accuracy

The bounds returned in FERR are not rigorous, because they are estimated, not computed exactly; but in practice they almost always overestimate the actual error.

8 Further Comments

For each right-hand side, computation of the backward error involves a minimum of $32nk$ real floating-point operations. Each step of iterative refinement involves an additional $48nk$ real operations. This assumes $n \gg k$. At most 5 steps of iterative refinement are performed, but usually only 1 or 2 steps are required.

Estimating the forward error involves solving a number of systems of linear equations of the form $Ax = b$; the number is usually 5 and never more than 11. Each solution involves approximately $16nk$ real operations.

The real analogue of this routine is F07HHF (SPBRFS/DPBRFS).

9 Example

To solve the system of equations $AX = B$ using iterative refinement and to compute the forward and backward error bounds, where

$$A = \begin{pmatrix} 9.39 + 0.00i & 1.08 - 1.73i & 0.00 + 0.00i & 0.00 + 0.00i \\ 1.08 + 1.73i & 1.69 + 0.00i & -0.04 + 0.29i & 0.00 + 0.00i \\ 0.00 + 0.00i & -0.04 - 0.29i & 2.65 + 0.00i & -0.33 + 2.24i \\ 0.00 + 0.00i & 0.00 + 0.00i & -0.33 - 2.24i & 2.17 + 0.00i \end{pmatrix}$$

and

$$B = \begin{pmatrix} -12.42 + 68.42i & 54.30 - 56.56i \\ -9.93 + 0.88i & 18.32 + 4.76i \\ -27.30 - 0.01i & -4.40 + 9.97i \\ 5.31 + 23.63i & 9.43 + 1.41i \end{pmatrix}.$$

Here A is Hermitian positive-definite, and is treated as a band matrix, which must first be factorized by F07HRF (CPBTRF/ZPBTRF).

9.1 Program Text

Note: the listing of the example program presented below uses **bold italicised** terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.
