NAG Fortran Library Routine Document F08AXF (CUNMLQ/ZUNMLQ)

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of **bold italicised** terms and other implementation-dependent details.

1 Purpose

F08AXF (CUNMLQ/ZUNMLQ) multiplies an arbitrary complex matrix C by the complex unitary matrix Q from an LQ factorization computed by F08AVF (CGELQF/ZGELQF).

2 Specification

```
SUBROUTINE FO8AXF(SIDE, TRANS, M, N, K, A, LDA, TAU, C, LDC, WORK,

LWORK, INFO)

ENTRY cunmlq (SIDE, TRANS, M, N, K, A, LDA, TAU, C, LDC, WORK,

LWORK, INFO)

INTEGER M, N, K, LDA, LDC, LWORK, INFO

complex A(LDA,*), TAU(*), C(LDC,*), WORK(*)

CHARACTER*1 SIDE, TRANS
```

The ENTRY statement enables the routine to be called by its LAPACK name.

3 Description

This routine is intended to be used after a call to F08AVF (CGELQF/ZGELQF), which performs an LQ factorization of a complex matrix A. The unitary matrix Q is represented as a product of elementary reflectors.

This routine may be used to form one of the matrix products

$$QC$$
, Q^HC , CQ or CQ^H ,

overwriting the result on C (which may be any complex rectangular matrix).

5 Parameters

1: SIDE – CHARACTER*1

Input

On entry: indicates how Q or Q^H is to be applied to C as follows:

```
if SIDE = 'L', Q or Q^H is applied to C from the left; if SIDE = 'R', Q or Q^H is applied to C from the right.
```

Constraint: SIDE = 'L' or 'R'.

2: TRANS - CHARACTER*1

Input

On entry: indicates whether Q or Q^H is to be applied to C as follows:

if
$$TRANS = 'N'$$
, Q is applied to C;

if TRANS = 'C',
$$Q^H$$
 is applied to C .

Constraint: TRANS = 'N' or 'C'.

M - INTEGER

Input

On entry: m, the number of rows of the matrix C.

Constraint: $M \ge 0$.

4: N – INTEGER

Input

On entry: n, the number of columns of the matrix C.

Constraint: N > 0.

5: K – INTEGER

Input

On entry: k, the number of elementary reflectors whose product defines the matrix Q.

Constraints:

$$M \ge K \ge 0$$
 if SIDE = 'L', $N \ge K \ge 0$ if SIDE = 'R'.

6: A(LDA,*) - complex array

Input/Output

Note: the second dimension of the array A must be at least max(1, M) if SIDE = L' and at least max(1, N) if SIDE = R'.

On entry: details of the vectors which define the elementary reflectors, as returned by F08AVF (CGELQF/ZGELQF).

On exit: used as internal workspace prior to being restored and hence is unchanged.

7: LDA – INTEGER

Input

On entry: the first dimension of the array A as declared in the (sub)program from which F08AXF (CUNMLQ/ZUNMLQ) is called.

Constraint: LDA $\geq \max(1, K)$.

8: TAU(*) - complex array

Input

Note: the dimension of the array TAU must be at least max(1, K).

On entry: further details of the elementary reflectors, as returned by F08AVF (CGELQF/ZGELQF).

9: C(LDC,*) - complex array

Input/Output

Note: the second dimension of the array C must be at least max(1, N).

On entry: the m by n matrix C.

On exit: C is overwritten by QC or Q^HC or CQ or CQ^H as specified by SIDE and TRANS.

10: LDC - INTEGER

Input

On entry: the first dimension of the array C as declared in the (sub)program from which F08AXF (CUNMLQ/ZUNMLQ) is called.

Constraint: LDC $> \max(1, M)$.

11: WORK(*) - complex array

Workspace

Note: the dimension of the array WORK must be at least max(1, LWORK).

On exit: if INFO = 0, the real part of WORK(1) contains the minimum value of LWORK required for optimum performance.

12: LWORK – INTEGER

Input

On entry: the dimension of the array WORK as declared in the (sub)program from which F08AXF (CUNMLQ/ZUNMLQ) is called, unless LWORK =-1, in which case a workspace query is assumed and the routine only calculates the optimal dimension of WORK (using the formula given below).

Suggested value: for optimum performance LWORK should be at least $N \times nb$ if SIDE = 'L' and at least $M \times nb$ if SIDE = 'R', where nb is the **blocksize**.

Constraints:

LWORK
$$\geq \max(1, N)$$
 or LWORK $= -1$ if SIDE $=$ 'L', LWORK $\geq \max(1, M)$ or LWORK $= -1$ if SIDE $=$ 'R'.

13: INFO – INTEGER

Output

On exit: INFO = 0 unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

Errors or warnings detected by the routine:

INFO < 0

If INFO = -i, the *i*th parameter had an illegal value. An explanatory message is output, and execution of the program is terminated.

7 Accuracy

The computed result differs from the exact result by a matrix E such that

$$||E||_2 = O(\epsilon)||C||_2$$

where ϵ is the *machine precision*.

8 Further Comments

The total number of real floating-point operations is approximately 8nk(2m-k) if SIDE = 'L' and 8mk(2n-k) if SIDE = 'R'.

The real analogue of this routine is F08AKF (SORMLQ/DORMLQ).

9 Example

See Section 9 of the document for F08AVF (CGELQF/ZGELQF).
