## F08XSF (CHGEQZ/ZHGEQZ)

**Note:** before using this routine, please read the Users' Note for your implementation to check the interpretation of ***bold italicised*** terms and other implementation-dependent details.

### 1 Purpose

F08XSF (CHGEQZ/ZHGEQZ) implements the  $QZ$  method for finding generalized eigenvalues of the complex matrix pair  $(A, B)$  of order  $n$ , which is in the generalized upper Hessenberg form.

### 2 Specification

```

SUBROUTINE F08XSF(JOB, COMPQ, COMPZ, N, ILO, IHI, A, LDA, B, LDB, ALPHA,
1                  BETA, Q, LDQ, Z, LDZ, WORK, LWORK, RWORK, INFO)
ENTRY      chgeqz (JOB, COMPQ, COMPZ, N, ILO, IHI, A, LDA, B, LDB, ALPHA,
1                  BETA, Q, LDQ, Z, LDZ, WORK, LWORK, RWORK, INFO)
INTEGER
real
complex
1          N, ILO, IHI, LDA, LDB, LDQ, LDZ, LWORK, INFO
CHARACTER*1   RWORK(*)
1          A(LDA,*), B(LDB,*), ALPHA(*), BETA(*), Q(LDQ,*),
1          Z(LDZ,*), WORK(*)
CHARACTER*1   JOB, COMPQ, COMPZ

```

The ENTRY statement enables the routine to be called by its LAPACK name.

### 3 Description

F08XSF (CHGEQZ/ZHGEQZ) implements a single-shift version of the  $QZ$  method for finding the generalized eigenvalues of the complex matrix pair  $(A, B)$  which is in the generalized upper Hessenberg form. If the matrix pair  $(A, B)$  is not in the generalized upper Hessenberg form, then the routine F08WSF (CGGHRD/ZGGHRD) should be called before invoking F08XSF (CHGEQZ/ZHGEQZ).

This problem is mathematically equivalent to solving the matrix equation

$$\det(A - \lambda B) = 0.$$

Note that, to avoid underflow, overflow and other arithmetic problems, the generalized eigenvalues  $\lambda_j$  are never computed explicitly by this routine but defined as ratios between two computed values,  $\alpha_j$  and  $\beta_j$ :

$$\lambda_j = \alpha_j / \beta_j.$$

The parameters  $\alpha_j$ , in general, are finite complex values and  $\beta_j$  are finite real non-negative values.

If desired, the matrix pair  $(A, B)$  may be reduced to generalized Schur form. That is, the transformed matrices  $A$  and  $B$  are upper triangular and the diagonal values of  $A$  and  $B$  provide  $\alpha$  and  $\beta$ .

The parameter JOB specifies two options. If  $JOB = 'S'$  then the matrix pair  $(A, B)$  is simultaneously reduced to Schur form by applying one unitary transformation (usually called  $Q$ ) on the left and another (usually called  $Z$ ) on the right. That is,

$$\begin{aligned} A &\leftarrow Q^H A Z \\ B &\leftarrow Q^H B Z \end{aligned}$$

If  $JOB = 'E'$  then at each iteration the same transformations are computed but they are only applied to those parts of  $A$  and  $B$  which are needed to compute  $\alpha$  and  $\beta$ . This option could be used if generalized eigenvalues are required but not generalized eigenvectors.

If  $JOB = 'S'$  and COMPQ and COMPZ are 'V' or 'I' then the unitary transformations used to reduce the pair  $(A, B)$  are accumulated into the input arrays  $Q$  and  $Z$ . If generalized eigenvectors are required then JOB must be set to 'S' and if left (right) generalized eigenvectors are to be computed then COMPQ (COMPZ) must be set to 'V' or 'I' rather than 'N'.

If COMPQ is set to 'I', then eigenvectors are accumulated on the identity matrix and on exit the array Q contains the left eigenvector matrix  $Q$ . However, if COMPQ is set to 'S' then the transformations are accumulated in the user-supplied matrix  $Q_0$  in array Q on entry and thus on exit Q contains the matrix product  $QQ_0$ . A similar convention is used for COMPZ.

Stewart G W and Sun J-G (1990) *Matrix Perturbation Theory* Academic Press, London

## 5 Parameters

1: JOB – CHARACTER\*1 *Input*

*On entry:* specifies the operations to be performed on  $(A, B)$ :

- if JOB = 'E', the matrix pair  $(A, B)$  on exit might not be in the generalized Schur form;
- if JOB = 'S', the matrix pair  $(A, B)$  on exit will be in the generalized Schur form.

*Constraint:* JOB = 'E' or 'S'.

2: COMPQ – CHARACTER\*1 *Input*

*On entry:* specifies the operations to be performed on  $Q$ :

- if COMPQ = 'N', the array Q is unchanged;
- if COMPQ = 'V', the left transformation  $Q$  is accumulated on the array Q;
- if COMPQ = 'I', the array Q is initialised to the identity matrix before the left transformation  $Q$  is accumulated in Q.

*Constraint:* COMPQ = 'N', 'V' or 'I'.

3: COMPZ – CHARACTER\*1 *Input*

*On entry:* specifies the operations to be performed on  $Z$ :

- if COMPZ = 'N', the array Z is unchanged;
- if COMPZ = 'V', the right transformation  $Z$  is accumulated on the array Z;
- if COMPZ = 'I', the array Z is initialised to the identity matrix before the right transformation  $Z$  is accumulated in Z.

*Constraint:* COMPZ = 'N', 'V' or 'I'.

4: N – INTEGER *Input*

*On entry:*  $n$ , the order of the matrices  $A$ ,  $B$ ,  $Q$  and  $Z$ .

*Constraint:*  $N \geq 0$ .

5: ILO – INTEGER *Input*

6: IHI – INTEGER *Input*

*On entry:* the indices  $i_{lo}$  and  $i_{hi}$ , respectively which defines the upper triangular parts of  $A$ . The submatrices  $A(1 : i_{lo} - 1, 1 : i_{lo} - 1)$  and  $A(i_{hi} + 1 : n, i_{hi} + 1 : n)$  are then upper triangular. These

parameters are provided by F08WVF (CGGBAL/ZGGBAL) if the matrix pair was previously balanced; otherwise, ILO = 1 and IHI = N.

*Constraints:*

$$\begin{aligned} 1 \leq \text{ILO} \leq \text{IHI} \leq N &\text{ if } N > 0; \\ \text{ILO} = 1 \text{ and } \text{IHI} = 0 &\text{ if } N = 0. \end{aligned}$$

7: A(LDA,\*) – **complex** array *Input/Output*

**Note:** the second dimension of the array A must be at least max(1,N).

*On entry:* the n by n upper Hessenberg matrix A. The elements below the first subdiagonal must be set to zero. If JOB = 'S', the matrix pair (A, B) will be simultaneously reduced to generalized Schur form. If JOB = 'E', the 1 by 1 and 2 by 2 diagonal blocks of the matrix pair (A, B) will give generalized eigenvalues but the remaining elements will be irrelevant.

8: LDA – INTEGER *Input*

*On entry:* the first dimension of the array A as declared in the (sub)program from which F08XSF (CHGEQZ/ZHGEQZ) is called.

*Constraint:*  $\text{LDA} \geq \max(1, N)$ .

9: B(LDB,\*) – **complex** array *Input/Output*

**Note:** the second dimension of the array B must be at least max(1,N).

*On entry:* the n by n upper triangular matrix B. The elements below the diagonal must be zero.

*On exit:* if JOB = 'S', the matrix pair (A, B) will be simultaneously reduced to generalized Schur form. If JOB = 'E', the 1 by 1 and 2 by 2 diagonal blocks of the matrix pair (A, B) will give generalized eigenvalues but the remaining elements will be irrelevant.

10: LDB – INTEGER *Input*

*On entry:* the first dimension of the array B as declared in the (sub)program from which F08XSF (CHGEQZ/ZHGEQZ) is called.

*Constraint:*  $\text{LDB} \geq \max(1, N)$ .

11: ALPHA(\*) – **complex** array *Output*

**Note:** the dimension of the array ALPHA must be at least max(1,N).

*On exit:*  $\alpha_j$ , for  $j = 1, \dots, n$ .

12: BETA(\*) – **complex** array *Output*

**Note:** the dimension of the array BETA must be at least max(1,N).

*On exit:*  $\beta_j$ , for  $j = 1, \dots, n$ .

13: Q(LDQ,\*) – **complex** array *Input/Output*

**Note:** the second dimension of the array Q must be at least max(1,N) if COMPQ = 'V' or 'I'. If COMPQ = 'N', Q is not referenced.

*On entry:* if COMPQ = 'V', the matrix  $Q_0$  is usually the matrix Q returned by F08NSF (CGEHRD/ZGEHRD).

If COMPQ = 'N', Q is not referenced.

*On exit:* If COMPQ = 'V', Q contains the matrix product  $QQ_0$ ; if COMPQ = 'I', Q contains the transformation matrix Q.

14:	LDQ – INTEGER	<i>Input</i>
<i>On entry:</i> the first dimension of the array Q as declared in the (sub)program from which F08XSF (CHGEQZ/ZHGEQZ) is called.		
<i>Constraints:</i>		
LDQ $\geq N$ if COMPQ = 'V' or 'I'; LDQ $\geq 1$ if COMPQ = 'N'.		
15:	Z(LDZ,*) – <i>complex</i> array	<i>Input/Output</i>
<b>Note:</b> the second dimension of the array Z must be at least $\max(1, N)$ if COMPZ = 'V' or 'I'. If COMPZ = 'N', Z is not referenced.		
<i>On entry:</i> if COMPZ = 'V', the matrix $Z_0$ . Usually, $Z_0$ is the matrix Z returned by F08WSF (CGGHRD/ZGGHRD). If COMPZ = 'N', Z is not referenced.		
<i>On exit:</i> if COMPZ = 'V', Z contains the matrix product $ZZ_0$ ; if COMPZ = 'I', Z contains the transformation matrix Z.		
16:	LDZ – INTEGER	<i>Input</i>
<i>On entry:</i> the first dimension of the array Z as declared in the (sub)program from which F08XSF (CHGEQZ/ZHGEQZ) is called.		
<i>Constraints:</i>		
LDZ $\geq N$ if COMPZ = 'V' or 'I'; LDZ $\geq 1$ if COMPZ = 'N'.		
17:	WORK(*) – <i>complex</i> array	<i>Workspace</i>
<b>Note:</b> the dimension of the array WORK must be at least $\max(1, LWORK)$ .		
<i>On exit:</i> if INFO = 0, WORK(1) contains the minimum value of LWORK required for optimum performance.		
18:	LWORK – INTEGER	<i>Input</i>
<i>On entry:</i> the dimension of the array WORK="x(82) as x(182)ared in the (sub)program from which F08XSF (CHGEQZ/ZHGEQZ) is called., unless LWORK = -1, in which case a workspace query is assumed and the routine only calculates the optimal dimension of WORK.		
<i>Constraint:</i> LWORK $\geq \max(1, N)$ or LWORK = -1.		
19:	RWORK(*) – <i>real</i> array	<i>Workspace</i>
<b>Note:</b> the dimension of the array RWORK must be at least $\max(1, 6 * N)$ .		
20:	INFO – INTEGER	<i>Output</i>
<i>On exit:</i> INFO = 0 unless the routine detects an error (see Section 6).		

## 6 Error Indicators and Warnings

Errors or warnings detected by the routine:

INFO < 0

If INFO =  $-i$ , the  $i$ th parameter had an illegal value. An explanatory message is output, and execution of the program is terminated.

INFO > 0

If  $1 \leq \text{INFO} \leq N$ , the  $QZ$  iteration did not converge and the matrix pair  $(A, B)$  is not in the generalized Schur form at exit. However, if  $\text{INFO} < N$ , then the computed  $\alpha_i$  and  $\beta_i$  should be correct for  $i = \text{INFO} + 1, \dots, N$ .

If  $N + 1 \leq \text{INFO} \leq 2 \times N$ , the computation of shifts failed and the matrix pair  $(A, B)$  is not in the generalized Schur form at exit. However, if  $\text{INFO} < 2 \times N$ , then the computed  $\alpha_i$  and  $\beta_i$  should be correct for  $i = \text{INFO} - N + 1, \dots, N$ .

If  $\text{INFO} > 2 \times N$ , then it indicates a variety of highly unusual failures.

## 7 Accuracy

Please consult section 4.11 of the LAPACK Users' Guide (Anderson *et al.* (1999)) and Chapter 6 of Stewart and Sun (1990), for more information.

## 8 Further Comments

This routine is the fifth step in the solution of the complex generalized eigenvalue problem and is called after F08WSF (CGGHRD/ZGGHRD).

The number of floating-point operations taken by this routine is proportional to  $n^3$ .

The real analogue of this routine is F08XEF (SHGEQZ/DHGEQZ).

## 9 Example

The example program computes the  $\alpha$  and  $\beta$  parameters, which defines the generalized eigenvalues, of the matrix pair  $(A, B)$  given by

$$A = \begin{pmatrix} 1.0 + 3.0i & 1.0 + 4.0i & 1.0 + 5.0i & 1.0 + 6.0i \\ 2.0 + 2.0i & 4.0 + 3.0i & 8.0 + 4.0i & 16.0 + 5.0i \\ 3.0 + 1.0i & 9.0 + 2.0i & 27.0 + 3.0i & 81.0 + 4.0i \\ 4.0 + 0.0i & 16.0 + 1.0i & 64.0 + 2.0i & 256.0 + 3.0i \end{pmatrix}$$

$$B = \begin{pmatrix} 1.0 + 0.0i & 2.0 + 1.0i & 3.0 + 2.0i & 4.0 + 3.0i \\ 1.0 + 1.0i & 4.0 + 2.0i & 9.0 + 3.0i & 16.0 + 4.0i \\ 1.0 + 2.0i & 8.0 + 3.0i & 27.0 + 4.0i & 64.0 + 5.0i \\ 1.0 + 3.0i & 16.0 + 4.0i & 81.0 + 5.0i & 256.0 + 6.0i \end{pmatrix}.$$

This requires calls to five routines: F08WVF (CGGBAL/ZGGBAL) to balance the matrix, F08ASF (CGEQRF/ZGEQRF) to perform the  $QR$  factorization of  $B$ , F08AUF (CUNMQR/ZUNMQR) to apply  $Q$  to  $A$ , F08WSF (CGGHRD/ZGGHRD) to reduce the matrix pair to the generalized Hessenberg form and F08XSF (CHGEQZ/ZHGEQZ) to compute the eigenvalues via the  $QZ$  algorithm.

### 9.1 Program Text

**Note:** the listing of the example program presented below uses ***bold italicised*** terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.
