NAG Fortran Library Routine Document G04AGF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of **bold italicised** terms and other implementation-dependent details.

1 Purpose

G04AGF performs an analysis of variance for a two-way hierarchical classification with subgroups of possibly unequal size, and also computes the treatment group and subgroup means. A fixed effects model is assumed.

2 Specification

```
SUBROUTINE GO4AGF(Y, N, K, LSUB, NOBS, L, NGP, GBAR, SGBAR, GM, SS, IDF, F, FP, IFAIL)

INTEGER

N, K, LSUB(K), NOBS(L), L, NGP(K), IDF(4), IFAIL

real

Y(N), GBAR(K), SGBAR(L), GM, SS(4), F(2), FP(2)
```

3 Description

In a two-way hierarchical classification, there are $k \geq 2$ treatment groups, the *i*th of which is subdivided into l_i treatment subgroups. The *j*th subgroup of group *i* contains n_{ij} observations, which may be denoted by

$$y_{1ij}, y_{2ij}, \ldots, y_{n_{ij}ij}.$$

The general observation is denoted by y_{mij} , being the mth observation in subgroup j of group i, for $1 \le i \le k$, $1 \le j \le l_i$, $1 \le m \le n_{ij}$.

The following quantities are computed

(i) The subgroup means

$$ar{y}_{.ij} = rac{\displaystyle\sum_{m=1}^{n_{ij}} y_{mij}}{n_{ij}}$$

(ii) The group means

$$ar{y}_{.i.} = rac{\sum\limits_{j=1}^{l_i} \sum\limits_{m=1}^{n_{ij}} y_{mij}}{\sum\limits_{j=1}^{l_i} n_{ij}}$$

(iii) The grand mean

$$ar{y}_{...} = rac{\displaystyle\sum_{i=1}^{k} \sum_{j=1}^{l_i} \sum_{m=1}^{n_{ij}} y_{mij}}{\displaystyle\sum_{i=1}^{k} \sum_{j=1}^{l_i} n_{ij}}$$

(iv) The number of observations in each group

$$n_{i.} = \sum_{j=1}^{l_i} n_{ij}$$

[NP3546/20A] G04AGF.1

(v) Sums of squares

Between groups
$$=SS_g=\sum_{i=1}^k n_{i.}(\bar{\boldsymbol{y}}_{.i.}-\bar{\boldsymbol{y}}_{...})^2$$
 Between subgroups within groups
$$=SS_{sg}=\sum_{i=1}^k\sum_{j=1}^{l_i}n_{ij}(y_{.ij}-\bar{\boldsymbol{y}}_{.i.})^2$$
 Residual (within subgroups)
$$=SS_{res}=\sum_{i=1}^k\sum_{j=1}^{l_i}\sum_{m=1}^{n_{ij}}(y_{mij}-\bar{\boldsymbol{y}}_{.ij})^2=SS_{tot}-SS_g-SS_{sg}$$
 Corrected total
$$=SS_{tot}=\sum_{i=1}^k\sum_{j=1}^{l_i}\sum_{m=1}^{n_{ij}}(y_{mij}-\bar{\boldsymbol{y}}_{...})^2$$

(vi) Degrees of freedom of variance components

Between groups: k-1Subgroups within groups: l-kResidual: n-lTotal: n-1

where

$$l = \sum_{i=1}^{k} l_i,$$
$$n = \sum_{i=1}^{k} n_i.$$

(vii) F ratios. These are the ratios of the group and subgroup mean squares to the residual mean square.

Groups $F_1 = \frac{\text{Between groups sum of squares}/(k-1)}{\text{Residual sum of squares}/(n-l)} = \frac{SS_g/(k-1)}{SS_{res}/(n-l)}$ Between subgroups (within group) sum of squares/(l-k) SS_{sol}

Subgroups $F_2 = \frac{\text{Between subgroups (within group) sum of squares}/(l-k)}{\text{Residual sum of squares}/(n-l)} = \frac{SS_{sg}/(l-k)}{SS_{res}/(n-l)}$

If either F ratio exceeds 9999.0, the value 9999.0 is assigned instead.

(viii) F significances. The probability of obtaining a value from the appropriate F-distribution which exceeds the computed mean square ratio.

Groups $p_1 = \text{Prob}(F_{(k-1),(n-l)} > F_1)$

Subgroups $p_2 = \text{Prob}(F_{(l-k),(n-l)} > F_2)$

where F_{ν_1,ν_2} denotes the central F-distribution with degrees of freedom ν_1 and ν_2 .

If any $F_i = 9999.0$, then p_i is set to zero, i = 1, 2.

Input

5 Parameters

1: Y(N) - real array

On entry: the elements of Y must contain the observations y_{mij} in the following order:

$$y_{111}, y_{211}, \dots, y_{n_{11}11}, y_{112}, y_{212}, \dots, y_{n_{12}12}, \dots, y_{11l_1}, \dots,$$

$$y_{n_{1l_1}1l_1},\ldots,y_{1ij},\ldots,y_{n_{ij}ij},\ldots,y_{1kl_k},\ldots,y_{n_{kl_k}kl_k}.$$

In words, the ordering is by group, and within each group is by subgroup, the members of each subgroup being in consecutive locations in Y.

2: N – INTEGER Input

On entry: the total number of observations, n.

3: K – INTEGER Input

On entry: the number of groups, k.

Constraint: $K \geq 2$.

4: LSUB(K) – INTEGER array

Input

On entry: the number of subgroups within group i, l_i , for i = 1, 2, ..., k.

Constraint: LSUB(i) > 0, for i = 1, 2, ..., k.

5: NOBS(L) – INTEGER array

Input

On entry: the numbers of observations in each subgroup, n_{ij} , in the following order:

$$n_{11}, n_{12}, \ldots, n_{1l_1}, n_{21}, \ldots, n_{2l_2}, \ldots, n_{k1}, \ldots, n_{kl_k}$$

Constraint:
$$n = \sum_{i=1}^{k} \sum_{j=1}^{l_i} n_{ij}$$
, that is $N = \sum_{i=1}^{l} NOBS(i)$ and $NOBS(i) > 0$, for $i = 1, 2, ..., l$.

6: L - INTEGER Input

On entry: the total number of subgroups, l.

Constraint: $L = \sum_{i=1}^{k} LSUB(i)$.

7: NGP(K) – INTEGER array

Output

On exit: the total number of observations in group i, n_i , for i = 1, 2, ..., k.

8: GBAR(K) - real array

Output

On exit: the mean for group i, \bar{y}_{i} , for i = 1, 2, ..., k.

9: SGBAR(L) - *real* array

Output

On exit: the subgroup means, \bar{y}_{ij} , in the following order:

$$\bar{y}_{.11}, \bar{y}_{.12}, \dots, \bar{y}_{.1l_1}, \bar{y}_{.21}, \bar{y}_{.22}, \dots, \bar{y}_{.2l_2}, \dots, \bar{y}_{.k1}, \bar{y}_{.k2}, \dots, \bar{y}_{.kl_k}$$

10: GM - real Output

On exit: the grand mean, $\bar{y}_{...}$.

[NP3546/20A] G04AGF.3

11: SS(4) - real array

Output

On exit: contains the sums of squares for the analysis of variance, as follows;

SS(1) = Between group sum of squares, SS_q ,

SS(2) = Between subgroup within groups sum of squares, SS_{sq} ,

SS(3) = Residual sum of squares, SS_{res} ,

SS(4) = Corrected total sum of squares, SS_{tot} .

12: IDF(4) – INTEGER array

Output

On exit: contains the degrees of freedom attributable to each sum of squares in the analysis of variance, as follows:

IDF(1) = Degrees of freedom for between group sum of squares,

IDF(2) = Degrees of freedom for between subgroup within groups sum of squares,

IDF(3) = Degrees of freedom for residual sum of squares,

IDF(4) = Degrees of freedom for corrected total sum of squares.

13: F(2) - real array

Output

On exit: contains the mean square ratios, F_1 and F_2 , for the between groups variation, and the between subgroups within groups variation, with respect to the residual, respectively.

14: FP(2) - real array

Output

On exit: contains the significances of the mean square ratios, p_1 and p_2 respectively.

15: IFAIL - INTEGER

Input/Output

On entry: IFAIL must be set to 0, -1 or 1. Users who are unfamiliar with this parameter should refer to Chapter P01 for details.

On exit: IFAIL = 0 unless the routine detects an error (see Section 6).

For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, for users not familiar with this parameter the recommended value is 0. When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.

6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

On entry, $K \leq 1$.

IFAIL = 2

On entry, LSUB(i) ≤ 0 , for some i = 1, 2, ..., k.

IFAIL = 3

On entry,
$$L \neq \sum_{i=1}^{k} LSUB(i)$$

G04AGF.4

$$IFAIL = 4$$

On entry,
$$NOBS(i) \le 0$$
, for some $i = 1, 2, ..., l$.

IFAIL = 5

On entry,
$$N \neq \sum_{i=1}^{l} NOBS(i)$$
.

$$IFAIL = 6$$

The total corrected sum of squares is zero, indicating that all the data values are equal. The means returned are therefore all equal, and the sums of squares are zero. No assignments are made to IDF, F, and FP.

$$IFAIL = 7$$

The residual sum of squares is zero. This arises when either each subgroup contains exactly one observation, or the observations within each subgroup are equal. The means, sums of squares, and degrees of freedom are computed, but no assignments are made to F and FP.

7 Accuracy

The computations are believed to be stable.

8 Further Comments

The time taken by the routine increases approximately linearly with the total number of observations, n.

9 Example

The example below has two groups, the first of which consists of five subgroups, and the second of three subgroups. The numbers of observations in each subgroup are not equal. The data represent the percentage stretch in the length of samples of sack kraft drawn from consignments (subgroups) received over two years (groups). For details see Moore *et al.* (1972).

9.1 Program Text

Note: the listing of the example program presented below uses **bold italicised** terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.
