# NAG Fortran Library Routine Document G08CBF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of **bold italicised** terms and other implementation-dependent details.

## 1 Purpose

G08CBF performs the one-sample Kolmogorov-Smirnov test, using one of the standard distributions provided.

## 2 Specification

```
SUBROUTINE GO8CBF(N, X, DIST, PAR, ESTIMA, NTYPE, D, Z, P, SX, IFAIL)

INTEGER

N, NTYPE, IFAIL

real

X(N), PAR(2), D, Z, P, SX(N)

CHARACTER*(*)

DIST

CHARACTER*1

ESTIMA
```

# 3 Description

The data consists of a single sample of n observations denoted by  $x_1, x_2, \ldots, x_n$ . Let  $S_n(x_{(i)})$  and  $F_0(x_{(i)})$  represent the sample cumulative distribution function and the theoretical (null) cumulative distribution function respectively at the point  $x_{(i)}$ , where  $x_{(i)}$  is the ith smallest sample observation.

The Kolmogorov-Smirnov test provides a test of the null hypothesis  $H_0$ : the data are a random sample of observations from a theoretical distribution specified by the user against one of the following alternative hypotheses

- (i)  $H_1$ : the data cannot be considered to be a random sample from the specified null distribution.
- (ii)  $H_2$ : the data arise from a distribution which dominates the specified null distribution. In practical terms, this would be demonstrated if the values of the sample cumulative distribution function  $S_n(x)$  tended to exceed the corresponding values of the theoretical cumulative distribution function  $F_0(x)$ .
- (iii)  $H_3$ : the data arise from a distribution which is dominated by the specified null distribution. In practical terms, this would be demonstrated if the values of the theoretical cumulative distribution function  $F_0(x)$  tended to exceed the corresponding values of the sample cumulative distribution function  $S_n(x)$ .

One of the following test statistics is computed depending on the particular alternative null hypothesis specified (see the description of the parameter NTYPE in Section 5).

For the alternative hypothesis  $H_1$ :

 $D_n$  – the largest absolute deviation between the sample cumulative distribution function and the theoretical cumulative distribution function. Formally  $D_n = \max\{D_n^+, D_n^-\}$ .

For the alternative hypothesis  $H_2$ :

 $D_n^+$  - the largest positive deviation between the sample cumulative distribution function and the theoretical cumulative distribution function. Formally  $D_n^+ = \max\{S_n(x_{(i)}) - F_0(x_{(i)}), 0\}$  for both discrete and continuous null distributions.

For the alternative hypothesis  $H_3$ :

 $D_n^-$  - the largest positive deviation between the theoretical cumulative distribution function and the sample cumulative distribution function. Formally if the null distribution is discrete then  $D_n^- = \max\{F_0(x_{(i)}) - S_n(x_{(i)}), 0\}$  and if the null distribution is continuous then  $D_n^- = \max\{F_0(x_{(i)}) - S_n(x_{(i-1)}), 0\}$ .

[NP3546/20A] G08CBF.1

The standardized statistic  $Z = D \times \sqrt{n}$  is also computed, where D may be  $D_n, D_n^+$  or  $D_n^-$  depending on the choice of the alternative hypothesis. This is the standardised value of D with no correction for continuity applied and the distribution of Z converges asymptotically to a limiting distribution, first derived by Kolmogorov (1933), and then tabulated by Smirnov (1948). The asymptotic distributions for the one-sided statistics were obtained by Smirnov (1933).

The probability, under the null hypothesis, of obtaining a value of the test statistic as extreme as that observed, is computed. If  $n \le 100$  an exact method given by Conover (1980) is used. Note that the method used is only exact for continuous theoretical distributions and does not include Conover's modification for discrete distributions. This method computes the one-sided probabilities. The two-sided probabilities are estimated by doubling the one-sided probability. This is a good estimate for small p, that is  $p \le 0.10$ , but it becomes very poor for larger p. If n > 100 then p is computed using the Kolmogorov–Smirnov limiting distributions; see Feller (1948), Kendall and Stuart (1973), Kolmogorov (1933), Smirnov (1933) and Smirnov (1948).

## 5 Parameters

1: N – INTEGER Input

On entry: the number of observations in the sample, n.

*Constraint*:  $N \geq 3$ .

2: X(N) - real array Input

On entry: the sample observations  $x_1, x_2, \ldots, x_n$ .

*Constraint*: the sample observations supplied must be consistent, in the usual manner, with the null distribution chosen, as specified by the parameters DIST and PAR. For further details see Section 8.

3: DIST – CHARACTER\*(\*) Input

On entry: the theoretical (null) distribution from which it is suspected the data may arise, as follows. If DIST = 'U', uniform distribution over (a, b) - U(a, b).

If DIST = 'N', Normal distribution with mean  $\mu$  and variance  $\sigma^2 - N(\mu, \sigma^2)$ .

If DIST = 'G', gamma distribution with shape parameter  $\alpha$  and scale parameter  $\beta$ , where the mean =  $\alpha\beta$ .

If DIST = 'BE', beta distribution with shape parameters  $\alpha$  and  $\beta$ , where the mean =  $\alpha/(\alpha + \beta)$ .

If DIST = 'BI', binomial distribution with the number of trials, m, and the probability of a success, p.

If DIST = 'E', exponential distribution with parameter  $\lambda$ , where the mean =  $1/\lambda$ .

G08CBF.2 [NP3546/20A]

If DIST = 'P', poisson distribution with parameter  $\mu$ , where the mean =  $\mu$ .

Any number of characters may be supplied as the actual argument, however only the characters, maximum 2, required to uniquely identify the distribution are referenced.

## 4: PAR(2) - real array

Input/Output

On entry: if ESTIMA = 'S', PAR must contain the known values of the parameter(s) of the null distribution as follows.

If a uniform distribution is used then PAR(1) and PAR(2) must contain the boundaries a and b respectively.

If a Normal distribution is used then PAR(1) and PAR(2) must contain the mean,  $\mu$ , and the variance,  $\sigma^2$ , respectively.

If a gamma distribution is used then PAR(1) and PAR(2) must contain the parameters  $\alpha$  and  $\beta$  respectively.

If a beta distribution is used then PAR(1) and PAR(2) must contain the parameters  $\alpha$  and  $\beta$  respectively.

If a binomial distribution is used then PAR(1) and PAR(2) must contain the parameters m and p respectively.

If a exponential distribution is used then PAR(1) must contain the parameter  $\lambda$ .

If a poisson distribution is used then PAR(1) must contain the parameter  $\mu$ .

If ESTIMA = 'E', PAR need not be set except when the null distribution requested is the binomial distribution in which case PAR(1) must contain the parameter m.

On exit: if ESTIMA = 'S', PAR is unchanged.

If ESTIMA = 'E' then PAR(1) and PAR(2) are set to values as estimated from the data.

Constraints:

```
if DIST = 'U', PAR(1) < PAR(2), if DIST = 'N', PAR(2) > 0.0, if DIST = 'G', PAR(1) > 0.0 and PAR(2) > 0.0, if DIST = 'BE', PAR(1) > 0.0 and PAR(2) > 0.0 and PAR(1) \leq 10^6 and PAR(2) \leq 10^6, if DIST = 'BI', PAR(1) \geq 1.0 and 0.0 < PAR(2) < 1.0 and PAR(1) \times PAR(2) \times (1.0 - PAR(2)) \leq 10^6 and PAR(1) < 1/\epsilon where \epsilon = machine precision, see X02AJF; if DIST = 'E', PAR(1) > 0.0, if DIST = 'P', PAR(1) > 0.0 and PAR(1) \leq 10^6.
```

#### 5: ESTIMA – CHARACTER\*1

Input

On entry: ESTIMA must specify whether values of the parameters of the null distribution are known or are to be estimated from the data.

If ESTIMA = 'S', values of the parameters will be supplied in the array PAR described above.

If ESTIMA = 'E', parameters are to be estimated from the data except when the null distribution requested is the binomial distribution in which case the first parameter, m, must be supplied in PAR(1) and only the second parameter, p, is estimated from the data.

Constraint: ESTIMA = 'S' or 'E'.

#### 6: NTYPE – INTEGER

Input

On entry: the test statistic to be calculated, i.e., the choice of alternative hypothesis.

NTYPE = 1

Computes  $D_n$ , to test  $H_0$  against  $H_1$ .

[NP3546/20A] G08CBF.3

NTYPE = 2

Computes  $D_n^+$ , to test  $H_0$  against  $H_2$ .

NTYPE = 3

Computes  $D_n^-$ , to test  $H_0$  against  $H_3$ .

Constraint: NTYPE = 1, 2 or 3.

7: D – **real** Output

On exit: the Kolmogorov-Smirnov test statistic  $(D_n, D_n^+)$  or  $D_n^-$  according to the value of NTYPE).

8: Z – real Output

On exit: a standardized value, Z, of the test statistic, D, without any continuity correction applied.

9: P – real Output

On exit: the probability, p, associated with the observed value of D, where D may be  $D_n$ ,  $D_n^+$  or  $D_n^-$  depending on the value of NTYPE (see Section 3).

10: SX(N) - real array Output

On exit: the sample observations,  $x_1, x_2, \ldots, x_n$ , sorted in ascending order,

11: IFAIL – INTEGER Input/Output

On entry: IFAIL must be set to 0, -1 or 1. Users who are unfamiliar with this parameter should refer to Chapter P01 for details.

On exit: IFAIL = 0 unless the routine detects an error (see Section 6).

For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, for users not familiar with this parameter the recommended value is 0. When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.

## 6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

On entry, N < 3.

IFAIL = 2

On entry, an invalid code for DIST has been specified.

IFAIL = 3

On entry, NTYPE  $\neq$  1, 2 or 3.

IFAIL = 4

On entry, ESTIMA  $\neq$  'S' or 'E'.

IFAIL = 5

On entry, the parameters supplied for the specified null distribution are out of range (see Section 5). Apart from a check on the first parameter for the binomial distribution (DIST = 'BI') this error will only occur if ESTIMA = 'S'.

G08CBF.4 [NP3546/20A]

IFAIL = 6

The data supplied in X could not arise from the chosen null distribution, as specified by the parameters DIST and PAR. For further details see Section 8.

IFAIL = 7

The whole sample is constant, i.e., the variance is zero. This error may only occur if (DIST = 'U', 'N', 'G' or 'BE') and ESTIMA = 'E'.

IFAIL = 8

The variance of the binomial distribution (DIST='BI') is too large. That is, mp(1-p) > 1000000.

IFAIL = 9

When DIST='G', in the computation of the incomplete gamma function by S14BAF the convergence of the Taylor series or Legendre continued fraction fails within 600 iterations. This is an unlikely error exit.

## 7 Accuracy

The approximation for p, given when n > 100, has a relative error of at most 2.5% for most cases. The two-sided probability is approximated by doubling the one-sided probability. This is only good for small p, i.e., p < 0.10, but very poor for large p. The error is always on the conservative side, that is the tail probability, p, is over estimated.

# **8** Further Comments

The time taken by the routine increases with n until n > 100 at which point it drops and then increases slowly with n. The time may also depend on the choice of null distribution and on whether or not the parameters are to be estimated.

The data supplied in the parameter X must be consistent with the chosen null distribution as follows.

```
When DIST = 'U', then PAR(1) \leq x_i \leq PAR(2) for i = 1, 2, ..., n.
```

When DIST = 'N', then there are no constraints on the  $x_i$ .

When DIST = 'G', then  $x_i \ge 0.0$ , for i = 1, 2, ..., n.

When DIST = 'BE' then  $0.0 \le x_i \le 1.0$ , for  $i = 1, 2, \dots, n$ .

When DIST = 'BI', then  $0.0 \le x_i \le PAR(1)$ , for i = 1, 2, ..., n.

When DIST = 'E', then  $x_i \ge 0.0$ , for i = 1, 2, ..., n.

When DIST = 'P', then  $x_i \ge 0.0$ , for i = 1, 2, ..., n.

## 9 Example

The following example program reads in a set of data consisting of 30 observations. The Kolmogorov–Smirnov test is then applied twice, firstly to test whether the sample is taken from a uniform distribution, U(0,2), and secondly to test whether the sample is taken from a Normal distribution where the mean and variance are estimated from the data. In both cases we are testing against  $H_1$ ; that is, we are doing a two-tailed test. The values of D, Z and P are printed for each case.

[NP3546/20A] G08CBF.5

## 9.1 Program Text

**Note:** the listing of the example program presented below uses **bold italicised** terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.
