NAG Fortran Library Routine Document

M01DZF

Note: before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

1 Purpose

M01DZF ranks arbitrary data according to a user-supplied comparison routine.

2 Specification

SUBROUTINE MO1DZF(COMPAR, M1, M2, IRANK, IFAIL)INTEGERM1, M2, IRANK(M2), IFAILLOGICALCOMPAREXTERNALCOMPAR

3 Description

M01DZF is a general-purpose routine for ranking arbitrary data. M01DZF does not access the data directly; instead it calls a user-supplied routine COMPAR to determine the relative ordering of any two data items. The data items are identified simply by an integer in the range M1 to M2.

M01DZF uses a variant of list-merging, as described by Knuth (1973), pp 165-166. The routine takes advantage of natural ordering in the data, and uses a simple list insertion in a preparatory pass to generate ordered lists of length at least 10.

4 References

5 Parameters

1: COMPAR – LOGICAL FUNCTION, supplied by the user.

External Procedure

COMPAR must specify the relative ordering of any two data items; it must return .TRUE. if item I must come strictly **after** item J in the rank ordering.

Its specification is:

LOGICAL FUNCTION COMPAR(I, J) INTEGER I, J 1: I – INTEGER 2: J – INTEGER On entry: I and J identify the data items to be compared. Constraint: M1 \leq I, J \leq M2.

COMPAR must be declared as EXTERNAL in the (sub)program from which M01DZF is called. Parameters denoted as *Input* must **not** be changed by this procedure.

Input

Input

2:

3:

Input Input

M2, and assigns ranks in the range M1 to M2 which are stored in elements M1 to M2 of IRANK.

Output

Input/Output

Constraint: $0 < M1 \le M2$.

M1 – INTEGER

M2 – INTEGER

4: IRANK(M2) - INTEGER array

On exit: elements M1 to M2 of IRANK contain the ranks of the data items M1 to M2. Note that the ranks are in the range M1 to M2: thus, if item i is first in the rank ordering, IRANK(i) contains M1.

On entry: M1 and M2 must specify the range of data items to be ranked, and the range of ranks to be assigned. Specifically, M01DZF ranks the data items identified by integers in the range M1 to

5: IFAIL – INTEGER

On entry: IFAIL must be set to 0, -1 or 1. Users who are unfamiliar with this parameter should refer to Chapter P01 for details.

On exit: IFAIL = 0 unless the routine detects an error (see Section 6).

For environments where it might be inappropriate to halt program execution when an error is detected, the value -1 or 1 is recommended. If the output of error messages is undesirable, then the value 1 is recommended. Otherwise, for users not familiar with this parameter the recommended value is 0. When the value -1 or 1 is used it is essential to test the value of IFAIL on exit.

6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors or warnings detected by the routine:

IFAIL = 1

 $\begin{array}{ll} \text{On entry,} & M2 < 1, \\ \text{or} & M1 < 1, \\ \text{or} & M1 > M2. \end{array}$

7 Accuracy

Not applicable.

8 **Further Comments**

The average time taken by the routine is approximately proportional to $n \times \log n$, where n = M2 - M1 + 1; it will usually be dominated by the time taken in COMPAR.

9 Example

The example program reads records, each of which contains an integer key and a *real* number. The program ranks the records first of all in ascending order of the integer key; records with equal keys are ranked in descending order of the *real* number if the key is negative, in ascending order of the *real* number if the key is positive, and in their original order if the key is zero. After calling M01DZF, the program calls M01ZAF to convert the ranks to indices, and prints the records in rank order. Note the use of COMMON to communicate the data between the main program and the function COMPAR.

9.1 Program Text

Note: the listing of the example program presented below uses *bold italicised* terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.
